access in a box
IPS COMBO CLUSTER

The IPS (integrated power supply) boxed solutions bring a new level of simplicity and convenience to installing an access control system, with all the key requirements housed in one secure box.

The powder coated metal housing is fitted with a high-end Meanwell switch mode power supply, and the solution comes pre-wired to ensure a rapid installation.

Another innovation is true plug-and-play hardware, which enables modules to simply clip into each other for an instant power and comms connection, without complex wiring. Each box can house up to four modules, whether Wiegand reader modules, Antenna reader modules or digital I/O modules, coupled with the cluster controller, to provide

enhanced flexibility for your specific installation needs. The housing also includes side breakouts, for seamless cable installation, when mounting a bank of boxes, as well as a standard cylinder breakout for the installation of a lock. The boxed solution comes with an optional 7 AH battery to ensure you are always backed up,

in case of power failures. The Access Portal Lite solution has the added benefit of a fully embedded web solution, which means no PC or additional software is required. Once wired, the system is configured through a web page making this one of the easiest systems to configure and setup.
